

WWViews on Global Warming

Recommendations of the citizen

1

Climate protection against business interests

Without the basic resource of protecting all and everything, no long-term economic development is possible, which is why no business interests of a country are to be accorded greater importance than climate protection.

Investing and incentivising

We ask states to allocate a significant portion of their budget to incentive measures, technological innovations and setting up infrastructures with the aim of reducing greenhouse gas emissions.

Together for the future

We recommend that a global deal be reached, universally honoured, aimed at reducing CO₂ emissions, by promoting better education, awareness and responsibility in the individual.

2

List of environmentally-friendly countries

An "eco list" of the countries participating in the climate treaty will be drawn-up (like the OECD list for banks). The list will contain obligations, goals, incentives, consequences and sponsorships (Appendix 1 countries as sponsors of developing countries).

Reducing CO₂ emissions by developing renewable energies

Encouraging the transfer of new technologies in developing countries to make use of their renewable energy potential (geothermal, solar, biomass, etc.) in an effort that benefits both parties.

+collaboration+clean energies = - CO₂

(>>more cooperation plus more clean energies = less CO₂)

Annex 1 countries shall use a percentage of their GDP to develop renewable energies and advanced technologies, while undertaking to transfer them to other countries in a framework of universal cooperation.

3

Environmental technology know-how for all

We request the establishment (or the development) of a global scientific pool, entrusted with the task of making the latest and proven and tested greenhouse reduction expertise freely available, and developing visions and projects.

One tax for one planet

We propose a global climate tax, based on:

1. Greenhouse gas emissions
2. Deforestation

The revenues generated by the tax will be allocated to:

1. Developing renewable energies
2. Encouraging major technological advances in the poorest countries

We are not afraid of “change”

We recommend a gradual replacement of fossil fuels with alternative sources of energy, such as wind, sun, and hydroelectric power.

We call upon governments to apply these new technologies and to grant generous subsidies to those countries that implement them.

More

SOS!!!

We and our children trust YOU that, together, you will co-operate to secure an ecological, benign earth and future. Please use renewable resources responsibly, without greed for profit (large group companies, IWC, WTO)

Responsibility and solidarity

By 2020, reducing global emissions by 25%, in particular through a CO2 tax levied according to the socio-economic context of each country and redistributed according to their vulnerability to climate change.

No title

To curb consumption by acting sustainably; to devise a universal Index of environmental impact, to do away with waste by fining obsolete technologies, to support alternative sources of energy by increasing investment, to apply sanctions on immoderate consumption while rewarding thrift.

GLOBAL WARMING: GLOBAL WARNING.

We recommend that an independent Supranational Authority be established and entrusted with the following responsibilities:

- To monitor and give due warning on greenhouse gas emissions
- To distribute all collected data
- To promote research and development.
